

THE AMERICAN BUSINESS OFFICE

When Bowne began 205 years ago our fine quill pens, india inks and parchment papers were the way the American Business office transacted and recorded its business.

During the next two centuries, Bowne continued to serve American Business — as a financial/business printer and as manager and producer of sensitive compliance documentation.

Bowne Information Systems continues this Bowne tradition. Nearly a decade ago BIS (then called Bowne Time Sharing) was among the first to apply the power of the computer as a tool for preparing and communicating the written word.

Today, BIS applies the latest technologies to helping American business offices solve a myriad of text and information problems. BIS systems solutions incorporate large scale computers, on-line information storage systems, special text software packages, communications networks, high speed laser imagers and printers and computer photocomposers.

This special technology is packaged and made readily available to any business office through The Bowne Connection. A BIS customer simply connects an ordinary communicating word processor (like Xerox, IBM, Lanier, Vydec or Lexitron) into the Bowne resource:

- for a wide range of document building applications
- for creating and searching information files
- for electronic text distribution
- for accessing special data bases
- for creating and tracking personalized letters
- for photocomposing text
- for using high speed laser printers.

And through its Cyberway Services Division, BIS has in place a network of service bureau centers to deliver the skills and experience of professionals in the areas of text capture and word processing, litigation support, records management, specification production, and correspondence management.

Indeed BIS office solutions today are a far cry from those quill pens and parchment papers in the Bowne & Co. Shop of 200 years ago.
